Background

As part of CNA's support to the Robert E. Mitchell Center for Prisoner of War Studies at the Naval Operational Medicine Institute (NOMI), CNA is examining RPOW data sources that currently reside at the Mitchell Center. In addition to the relational database maintained by the Mitchell Center (see *An Examination of the Repatriated Prisoners of War Data Bank*, CNA Information Memorandum 580, December 1998), there are a large number of tapes that were created in the 1970s during the operation of the Center for Prisoner of War Studies (CPWS). The CPWS was established after the repatriation of the Vietnam-era POWs. When its operations concluded in 1980, the RPOW records and archives went to the Navy Aeromedical Research Laboratory.¹ This material is now held at NOMI under the auspices of the Mitchell Center.

Thirty-four tapes were created with data on Vietnam-era RPOWs during the early years of repatriation (1974-78). Nineteen of these tapes were processed with some preliminary analyses performed, but no follow-on work was done. Specifically, there has been no attempt to make these data available to researchers, or to document the status of the data stored on the tapes. NOMI and the Mitchell Center have asked us to examine all these 34 old data sources to see if they contain information that could be made available to both internal and external researchers exploring the effects of long-term captivity.

Description of the data

Our initial evaluation of the old tape data indicates that lack of use over the years has resulted in the loss of some data, which may or may not be recoverable. Of the tapes identified by the Mitchell Center,

-
1. It is now known as the Naval Aerospace Medical Research Laboratory (NAMRL).

some contain reasonable documentation, making it possible to evaluate the data and generate a partial codebook for potential users. However, other tapes we obtained were completely blank, and it is not clear whether master copies exist with intact data. Still other tapes contained data but no documentation to help in deciphering the record layout or identifying data elements. Two tapes—identified as masters—are of significant initial interest. They are compilations of other data tapes and provide a collection of data elements that were, at that point in time, judged to be most useful. However, the documentation was limited and not in user-friendly form, and these tapes have not been available for general use until now.

The goal of this effort is to document the two master tapes, offering systematic information about the contents of the tapes as accurately and completely as possible. These two tapes have the highest priority to document because they provide summary information from some of the other old data tapes. They represent a compilation of some of the oldest data available, from 1974 to 1978 (i.e., the period immediately after repatriation and before the Navy introduced a control group to its study).² In addition, one of them (master tape 7) includes information for servicemen across all four branches. The document is intended to serve as a reference source for researchers interested in using these data for RPOW research. Therefore, we will describe the contents of the two master tapes, document the record layouts, and prepare codebooks to assist future research efforts.

Master tape 6, also known as the J-Tape, is a compilation of data believed to be significant based on the CPWS initial evaluation over the range of available data. It includes capture and post-capture status, as well as medical, psychological, and treatment data. Because there are 1,098 cases (individuals) with 99 records per case, we know that this tape includes information on individuals who are not RPOWs. Tape 7 is simply called the Master Tape: it contains demographic information, along with medical and treatment status, over all service branches, and has 2,083 cases. These master tapes include information for some individuals who were determined to be killed

2. This is also the period when Army and Air Force RPOWs, in addition to the Navy and Marine Corps ones, were included.

in action (KIA) and for some who had missing-in-action (MIA) status. For the purpose of RPOW studies, we must exclude non-RPOWs from our data analyses. The "method" section will give the details of the screening process that separates RPOWs from the other individuals included in the datasets on these master tapes.

Of the 34 tapes that exist for this period of time, 3 are completely blank and 12 are unreadable due to the lack of documentation and format. So the actual number of useful tapes is 19.

Method

We used the same general approach for both master RPOW tapes. First, we obtained the following basic information for each variable in the data file: label, variable type, length, starting position, number of observations, number of missing values, minimum and maximum values, and the coding definition (if available). We then organized the information into two parts: (1) a set of summary tables by Records in appendices A and B and (2) a codebook-like listing of the characteristic and coding definitions of the variables (also by Records) in appendices C and D. The rationale for the design of the four appendices is that the first two will be a useful guide for data processing and the second two will be useful for data interpretation. Furthermore, to protect the privacy of the RPOWs, we have suppressed all personal information (social security number, first name, last name, etc.) throughout the document.

As stated earlier, we had to separate RPOWs from non-RPOWs in the data tapes. Initially, we tried to weed out non-RPOWs by variables on "status" on tapes 6 and 7, only to find that the various "status" variables have different frequency distributions. Because we cannot determine which "status" variable is the correct one, we abandoned this approach. As an alternative, we used Mitchell Center's RPOW list to identify the individuals for our analysis. The Mitchell Center list has 630 RPOWs with valid social security numbers (SSNs). We

matched these RPOWs to the data tapes by SSN,³ first name and last name, allowing for some spelling variations. The results are 265 RPOWs found on tape 6 and 591 identified on tape 7. Tape 7 has more RPOWs because it includes USAF personnel, whereas tape 6 does not.

Data overview

Tape 6: J-Master Tape Records

Tape 6 is a collection of pieces of the other tapes. According to the Mitchell Center's documentation, at some time the CPWS personnel extracted items believed to be significant and placed them on this tape. It includes capture and post-capture status, as well as medical, psychological, and treatment (during capture) data. The tape has 1,098 observations, but only 265 of them match the Mitchell Center RPOW list. Among these 265 RPOWs, 145 are Navy, 37 are Marine Corps, and 76 are Army.

Tape 6 has a major problem that makes it difficult to use the data—insufficient supporting information for decoding the data. Many variables do not have a label, and many of the ones that do have undefined values. Specifically, most of the tape 6 data are scores or coded answers from interviews and psychological tests. It is impossible to interpret these scores/codes without the original questionnaire. The only coding definitions available are for Records 11 through 16,⁴ and the only questionnaire available is the Personality Research Form for Record 18. Other than that, the vast majority of the data remains inexplicable. Compounding this problem are the numerous dashes (“-”) in the data. Not knowing the valid value range for the variables, we are unable to determine whether these dashes denote negative values or are missing/invalid values themselves. We are planning to

-
3. We have permission from the Mitchell Center to use the SSNs with the understanding that we will not reveal them or any other personal information to the public.
 4. Although we also have coding definitions for Record 17, the definitions simply do not make much sense.

examine data held in boxed files at the Mitchell Center in the near future, and it is possible that these nonelectronic data will provide useful background material to assist in decoding these variables.

Tape 7: Master Tape Records

Tape 7 is the master tape that contains detailed demographic information as well as medical, during-capture treatment, and post-release status. There are 2,083 cases on tape 7. However, only 591 of them match the Mitchell Center list by both SSN and name. Among the 591 RPOWs, 145 are Navy, 38 are Marine Corps, 82 are Army, and 326 are Air Force.

Most of the variables on tape 7 are well defined or self-evident, although some are without coding definitions (e.g., ED_LVL, ED_SVCMN, PRE_STAT). However, we found some unlabeled and undefined data in Records 77 through 88, and on positions 41-46 in Records 92 and 95. The data on positions 41-46 in Records 92 and 95 look like the wives' birthdays, but we cannot verify that.

One problem with tape 7 is that, in two instances, variables that purport to give the same information have inconsistent codes/values. The first instance is the five variables on "status": MSTATUS, STAT_CD, PRE_STAT, STAT_TOC, and STAT_PNS, whose frequency distributions are totally inconsistent with one another. The second instance is the variables on marital status: MAR_CODE and MAR_STA2. Because there is no way to determine which, if any, of these "status" variables is correct, researchers should exercise caution in using these variables. As we examine data from the remaining tapes in the future, other details may become apparent to illuminate the differences between MAR_CODE and MAR_STA2.

Specific data in appendices

The remainder of this documentation will be provided in appendices A through D. The first two (A and B) include summary tables that describe the variables found on master tapes 6 and 7. These appendices are intended to provide a useful guide for data-processing efforts. The first set of variables is from tape 6, followed by the information

found on tape 7. This listing proceeds with a record-by-record description of the variables found, along with summary information outlined as follows:

Variable	Label	Type	Start pos	Len	Obs	Missing	Min	Max
----------	-------	------	-----------	-----	-----	---------	-----	-----

Each variable has a label attached, which offers a summary description of the contents. Next we list the type of variable (e.g., character data), the starting position on the dataset, and the length of the variable. The next column details the number of observations for that variable, followed by the number of observations that we believe have missing data. The final two columns hold information on the minimum and maximum values we have observed for the variable in question.

Note that the descriptive statistics are only for those individuals who were identified as RPOWs. Researchers who use copies of the original data will need to be able to apply the algorithm we used to strip out the non-RPOWs. Alternatively, the Mitchell Center may provide an extract of the initial master tapes, which contains data for RPOWs only.

Appendices C and D provide a codebook approach to the data on the master tapes, again for tape 6 followed by tape 7, and are intended as an aid for data interpretation. In each record, the first four positions are CASE, and the last three positions are end of data flag (one position) and record number (two positions). An example of an entry for appendices C and D for master tape 6 follows:

Record 1: Master data list

CASE Case Number

Variable type: N

Length: 4

Number of unique values: 265

Value range: (0001, 5473)

Conclusions

The information entries listed in the appendices are not complete, but they offer the best current assistance to deciphering the data accessible from the master tapes. It is possible that subject matter experts will be able to glean more knowledge from specific elements than we are able to do (e.g., psychologists may be able to more clearly interpret some of the psychological entries, and physicians may more clearly comprehend the natural boundaries of data for medical variables). However, this documentation provides summary information to assist future research in several ways, by:

- Providing a coherent layout of the data
- Indicating the range of observations of the data elements
- Establishing value labels where available
- Delineating the RPOWs separately from data extraneous to RPOW research
- Demonstrating the difficulties with relying on variables that seemingly “should” provide identical information but, in fact, carry different information (e.g., status variables).

Users of these data are cautioned that these are not “clean” datasets. Many anomalies are embedded in the data, and potential data users should approach with care. Specific notes are included in the appendices for discrepancies and explicit problems we have noted with the data. However, it is likely that these data contain many inconsistencies that we have not captured in this initial examination.

³ The Personality Research Form (PRF) is a tool used to measure the deviation of a number of personality traits from the "norm". Each personality trait has a score ranged from 0 to 20, but the "norm" for each area measured is not constant and differs by gender as well. For a graph of the "norm" for each measured area, see appendix E.

Note: the number of unique values and value range vary slightly by variables. For each individual variable, please see Sec. 6.1.

Record 38: PE-OH raw loss

PR5 Pre Right 500

Variable type: N

Length: 4

Number of unique values: 16

Value range: (-10, 39)

PR10 Pre Right 1000

Variable type: N

Length: 4

Number of unique values: 9

Value range: (-10, 35)

PR20 Pre Right 2000

Variable type: N

Length: 4

Number of unique values: 15

Value range: (-10, 50)

PR40 Pre Right 4000

Variable type: N

Length: 4

Number of unique values: 27

Value range: (-5, 96)

PL5 Pre Left 500

Variable type: N

Length: 4

Number of unique values: 15

Value range: (-10, 34)

PL10 Pre Left 1000

Variable type: N

Length: 4

Number of unique values: 8

Value range: (-10, 25)

PL20 Pre Left 2000

Variable type: N
Length: 4
Number of unique values: 16
Value range: (-10, 45)

PL40 Pre Left 4000

Variable type: N
Length: 4
Number of unique values: 28
Value range: (-10, 75)

OR5 OH Right 500

Variable type: N
Length: 4
Number of unique values: 8
Value range: (-5, 30)

OR10 OH Right 1000

Variable type: N
Length: 4
Number of unique values: 8
Value range: (-5, 30)

OR20 OH Right 2000

Variable type: N
Length: 4
Number of unique values: 13
Value range: (-5, 60)

OR40 OH Right 4000

Variable type: N
Length: 4
Number of unique values: 18
Value range: (-5, 90)

OL5 OH Left 500

Variable type: N
Length: 4
Number of unique values: 8
Value range: (-5, 35)

OL10 OH Left 1000

Variable type: N
Length: 4
Number of unique values: 8
Value range: (-5, 30)

OL20 OH Left 2000

Variable type: N
Length: 4
Number of unique values: 14
Value range: (-15, 60)

OL40 OH Left 4000

Variable type: N
Length: 4
Number of unique values: 18
Value range: (-5, 80)
